

Alternator “windings” coolers with DOUBLE WALL LEAKAGE DETECTION.

Used to cool the motor windings within the alternator, these units have the appearance of a charge air cooler or an air conditioning unit. In reality, they are more specialized than that.

In most cases they have special “double wall” tubes. (Often known as leak detector tubes). It is essential that water never leaks into the windings of the alternator. In the event of a tube failure, water leaks between the outer and inner tubes and then to a void between an outer and inner tube plate. The water then leaks to the outside, thus warning the chief engineer there is a problem whilst not endangering the windings. *This is the reason for the name “leak detector tubes”*

Replacements to any brand of cooler. Made to measure so that the new unit is interchangeable with the existing water covers.

Vestas aircoil a/s, Smed Hansens vej 13, 6940 Lem, Denmark.
